

# IF I HAD THE OPTION...

**By Natalie**

It's not all fun and games at the NASA center. Okay, well, it may be mostly playing while on the job. But you have to be able to design rockets, test theories, and a lot more other things involving space. And what would you do, if you could send something to space and find something out with it? I know what I would do!

If I could send something, it would be a spacecraft with a video camera. I would like to explore the other planets. I want to see if there are any resemblances between Earth and the other planets, such as water, gravitational pull, and some of the landforms. These landforms would include mountains, valleys, lakes, plains, plateaus, etc. I would also like to see if human life form could live there. It would probably be on a planet that resemblances the Earth. And the planet that I believe could best support human life form would be Mars. We haven't really explored the other planets so I don't know if there are any other Earth-like planets. I would also like to look for other life forms. It is fairly possible that there are other types of life forms. There are 20 galaxies in our cluster including our Milky Way Galaxy. There are also *many* other clusters with *many* other galaxies with *many* other planets. Different life forms can adapt to anything, so we think. Why can't others adapt to other planets?
